

US Space Navy

Thank you for buying this model pack.

To use the models, simply drag the prefabs, located in the "Prefabs" folder into your scene.

Customization

This pack contains a spaceship model, 7 turrets, 1 missile launcher and 3 missiles. Also 5 different texture sets are included.

The spaceship consists of modular parts. They can be combined in various different ways to create unique spaceships.

The weapons can be attached to the ship hull to create different weapon loadouts.

PSD Source File

The PSD can be used to modify/change the textures. It also provides all necessary texture maps for making new ones with quixel mixer or substance painter.

Scaling of the models

The scaling of spaceships in general is a problem, simply because there is no “correct scale”. E.g. for human models it is clear that they should be 1.8 unity units tall (=1.80 meters). But in a space game you have no terrain or other props like trees, stones, houses, etc. to compare them to.

This means you have to decide what scale you want to use in your space game, e.g.

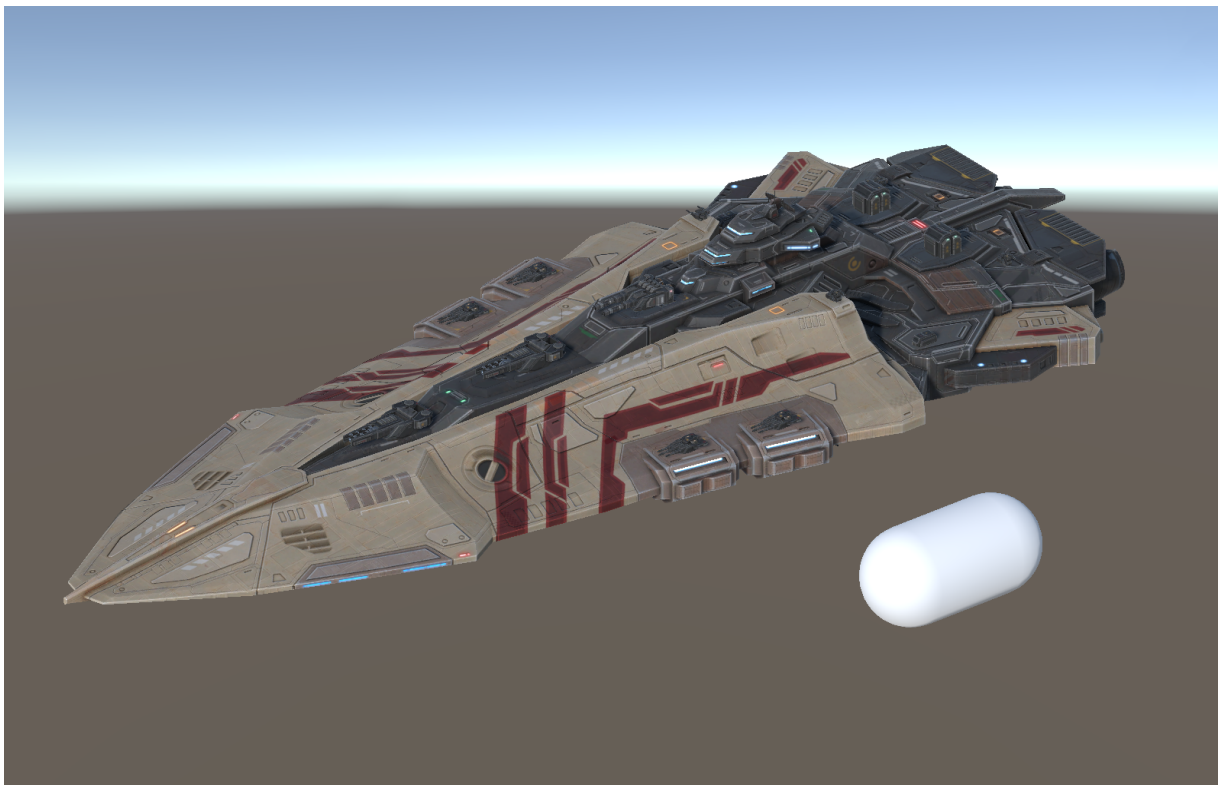

- a 1:1 scale means that 1 unity unit is 1 meter
- a 1:10 scale means that 1 unity unit equals 10 meters
- a 1:250 scale means that 1 unity unit equals 250 meters

The ships are scaled with a benchmark of ca. 10 unity units for a capital ship (e.g. battleship or carrier). This means smaller ships (e.g. frigates or fighters) are smaller than 10 unity units to match the bigger ships.

You must decide which scale fits best for your game.

For frigates and fighters only: This pack has two prefab folders: „Prefabs“ and „Prefabs Unity Dimensions“. The models in the “Prefabs” folder are meant to be used together with my other spaceships and are therefore scaled in relation to those ships.

The models in the “Prefabs Unity Dimensions” are intended to be used separately. They are scaled so that they are at least 2 unity units big.

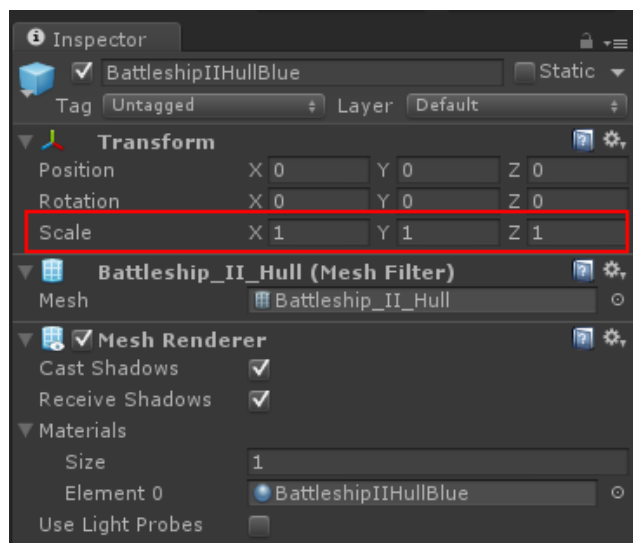

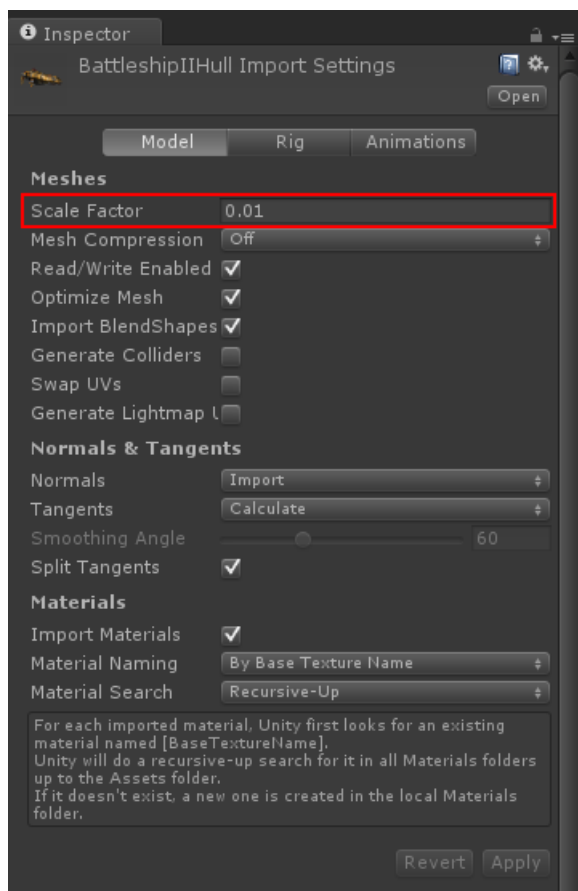

Rescaling

First you must decide which scale you want to use. Then you have to rescale one of the ships to find the correct rescale factor. And finally this rescale factor must be applied to all prefabs.

The default 2 unity unit scale makes it easier to rescale the models. E.g. let's say the battleship should be 10 unity units long. The model must simply be scaled up by 5. All other ships can then also be scaled up by the factor 5 so they all keep their size relation.

There are 2 options to rescale a model. It can either be done in the import settings of a model or with the transform scale of the prefabs.

Contact Information

You can contact me here: msgdi@yahoo.de. Please include your invoice number.

I always appreciate ratings/reviews on the asset store if you think this pack deserves it. Thank you.
